PHP PROJECT

Think of a web application that you would like to create.

Minimum requirements of the project:

- You must program using only the methodology and knowledge that we studied this trimester.
- It uses a form to collect user input data, applying the security measures that we learned this trimester.
- There must be a database with a table.
- Use a lass to map the table. Separate the code that accesses the database (no GUI interaction) from the code that corresponds to the GUI.
- It must use cookies.
- The user interface must be all written in English.
- You must prepare the documentation as described below.

1. Design your application.

1.1 Description.

Describe the web application that you will create for this project.

List of functionalities.

Table description.

1.2. GUI design.

Design of the main screen of your project. Describe the available options.

1.3. How to submit this task.

pdf file with your name as the name of the file.

2. Create your application.

2.1. Configure git and the remote repository on gitlab.iessanclemente.net

Create a directory called "projectDWCS" in "Documentos", so that it is stored locally on your computer, or use an usb storage device.

Create a directory within "projectDWCS" that is called "PHPproject".

Syncronice the directory projectDWCS with the main branck on gitlab.iessanclemente.net.

Every day that you work on your project you must syncronice it with the remote repository.

Instructions on "mestre".

2.1. Create the database.

Create the database using phpmyadmin and/or SQL commands.

Create the table in the database.

2.2. Create the classes that interact with the database.

There will be no interaction with the user within these classes.

Test that the method´s execution is correct.

2.3. Create the GUI.

2.4. How to submit this task.

Create a .zip file with your name that contains:

- pdf file with the screen captures and the additional information that you consider appropriate.
- Source files of the application.
- Challenges.txt: If you had new challenges to solve when creating your app describe them here.

3. Oral examination: project defence.

Project score:

- (1 point) Project design.
- It uses a form to collect user input data, applying the security measures that we learned this trimester.
- There must be a database with a table.
- Use a class to map the table. Separate the code that accesses the database (no GUI interaction) from the code that corresponds to the GUI.
- It must use cookies.
- Other aspects to take into account:
  - GUI functionality: aspect, clarity and easy to navigate.
  - Originality of the idea.
  - Use only the code and techniques learned in the classroom. **This is a strict requirement.**
  - Clarity, modularization and organization of the code, using comments where necessary.
  - Security against possible hacking.

- Error control.
